

Antario

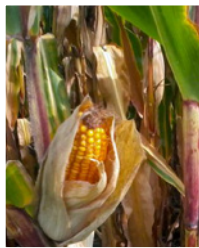

Antario provides protection against early leaf damage caused by caterpillars and other insects. It contains two biological insecticides: *Bacillus thuringiensis kurstaki* and Abamectin. The two biological pesticides act together to kill the insect by releasing endotoxins when the insect feeds. Antario provides safe, effective and biodegradable protection for the following crops:

Sorghum

Rice

Maize

Tomato

Cabbage

Target Pests include:

Tomato leafminer, fall armyworm and other caterpillars, whitefly, aphids and spider mites.

Application:

- Mix 15-25g of Antario in 20 litres of water. Use 100 litres over 1000m²
- When the first signs of damage are apparent, apply Antario every 7-10 days until insect numbers are significantly reduced. Apply using conventional equipment and spray when the crop is dry. Re-apply if it rains within 8 hours of spraying.
